

// DATA ENGINEER PYTHON TEST

Convert the weather data into parquet format. Set the row group to the appropriate value you see fit for this data

The converted data should be able to answer the following question.

- Which date was the hottest day?
- What was the temperature on that day?
- In which region was the hottest day?

Please provide the source code, tests, documentations and any assumptions you have made.

Note: We are looking for the candidate's "Data Engineering" ability, not just the Python programming skills.

The weather data is provided separately
